1. PilotBench: A Benchmark for General Aviation Agents

Yalun Wu*, Haotian Liu*, Zhoujun Li, Boyang Wang

IEEE International Joint Conference on Neural Networks (IJCNN 2026). *arXiv:2604.08987*

A flight-agent benchmark built from 708 real-world trajectories and 34-channel telemetry. Evaluation across 41 models identifies a precision–controllability trade-off and a dynamic-complexity gap in high-workload flight phases. Pilot-Score combines regression accuracy with instruction following and constraint compliance. Traditional forecasters reach MAE 7.01, while LLMs achieve 86–89% instruction following at 11–14 MAE.

2. FLY-EVAL++: An Evidence-Driven Evaluation Protocol for Flight Prediction with Large Language Models

Yalun Wu, Junfeng Fang, Jiawei Wang, Haotian Liu, Qijun Yang, Minghan Yang, Hongcheng Guo, Zhoujun Li, Boyang Wang

Conference on Language Modeling (CoLM 2026). *arXiv:2609.04021*

An evidence-driven protocol for structured validity, physical feasibility, and constraint compliance in flight prediction. Across 66 LLMs, predictive quality and constraint compliance emerge as distinct capability dimensions, with a 28.2-point constraint gap at comparable predictive quality.

MANUSCRIPTS

3. LFUSE: Learned Evidence Fusion for Noisy Spoken and Image-Grounded Product Search

Haotian Liu, Xiaowen Liu, Yunhan Wang, Yalun Wu, Minghan Yang, Xinhao Yu, Boyang Wang

ICASSP 2027 – Under review. First author.

A learned evidence-fusion model that reranks the union of BM25 and dense candidates using rank, character, pinyin, and query-agreement features, with noise-aware training for corrupted and ASR queries. It improves MRR@10 over tuned convex fusion by 7.8% on average across three human-judged Chinese Multi-CPR domains and lowers fusion-stage latency by 80–100× versus LLM-based adaptive fusion.

4. Before the Agent Acts: Understanding, Task Accounts, and Implementation in Pre-Coding Review

Haotian Liu, Mingyue Zhang, Nianyu Li, Eunsuk Kang, Jialong Li

Manuscript in preparation.

Introduces Collaborative Evidence-Constrained Task Interpretation (CETI), a repository-grounded pre-coding review workflow with editable, source-linked task Records. A 24-participant study over 72 cases reports a +17.2 percentage-point adjusted Records-2 versus FreeChat-2 contrast in objective understanding; a linked audit traces 102 request occurrences through 93 families and 504 coding attempts across 10 tasks and 3 models. Exact criteria cover 20 of 24 core families and 4 of 25 boundary families.

* Equal contribution.
